APPENDIX D
STANDARD SPECIFICATIONS FOR SEWER MAINS

Last Approved Revision: March 28, 2019
TABLE OF CONTENTS

SECTION I – GENERAL REQUIREMENTS ................................................................. 5
1.1 Authority ................................................................................................................. 5
1.2 Effective Date of Specifications ........................................................................... 5
1.3 Revisions, Amendments, or Additions ................................................................. 5
1.4 Definitions ............................................................................................................. 5
1.5 Development Approval and Infrastructure Acceptance ....................................... 5
1.6 Variance .................................................................................................................. 5

SECTION II – COLLECTION SYSTEM DESIGN AND LAYOUT ......................... 6
2.1 General Requirements ......................................................................................... 6
2.2 Corrosion .............................................................................................................. 6
  2.2.1 Dissimilar Materials ....................................................................................... 6
  2.2.2 Insulating Joints .......................................................................................... 6
2.3 Sizing Collection Mains ..................................................................................... 6
2.4 Layout of the Collection System ....................................................................... 7
  2.4.1 Easement Width Requirements for Main Installations ................................. 7
  2.4.2 Minimum Size .............................................................................................. 7
  2.4.3 Depth of Bury ................................................................................................ 7
  2.4.4 Main Insulation Requirements ................................................................. 8
  2.4.5 Minimum Distance from Structures ......................................................... 8
  2.4.6 Installations in High Groundwater ............................................................ 8
2.5 Slope of Sewer Mains ....................................................................................... 8
  2.5.1 Minimum Slopes .......................................................................................... 8
  2.5.2 Maximum Slopes ......................................................................................... 9
  2.5.3 Slope between Manholes .......................................................................... 9
  2.5.4 Steep Slope Applications .......................................................................... 9
  2.5.5 Slope across Manholes .......................................................................... 10
  2.5.6 Main Line Horizontal Alignment .................................................................. 10
  2.5.7 Length of Mains and Slope Measurement ............................................... 10
  2.5.8 Manholes .................................................................................................. 10
  2.5.9 Manhole Clearances ............................................................................... 11
  2.5.10 Manhole Connections ............................................................................. 11
  2.5.11 Location/Marking Tape .......................................................................... 11
  2.5.12 Pipe Material ............................................................................................ 12
  2.5.13 Lift Stations ............................................................................................... 12
  2.5.14 Maintenance Access ................................................................................ 12
2.6 Protection of Potable Water Supplies ............................................................... 12
  2.6.1 Cross Connections Prohibited .................................................................. 12
  2.6.2 Relation to Water Works Structures ......................................................... 12
  2.6.3 Horizontal and Vertical Separation from Potable Water Mains ................ 12

SECTION III – MATERIAL SPECIFICATIONS ..................................................... 14
3.1 General Requirements ....................................................................................... 14
3.2 Pipe and Fittings ............................................................................................... 14
  3.2.1 Polyvinyl Chloride (PVC) gravity pipe .................................................. 14
  3.2.2 Polyvinyl Chloride (PVC) pressure pipe ............................................... 14
3.2.3 Ductile Iron Pipe (DIP) .......................................................... 15
3.2.4 Service Line Taps ............................................................... 15
3.2.5 Transition Adapter ........................................................... 15
3.3 Manholes................................................................. 15
  3.3.1 Manhole ................................................................. 15
  3.3.2 Water Tightness .......................................................... 15
  3.3.3 Rings and Covers ........................................................ 15
  3.3.4 Grade Rings .............................................................. 16
  3.3.5 Manhole steps ............................................................ 16
  3.3.6 Joint Sealant ............................................................... 16
  3.3.7 Pipe to Manhole Seal ................................................... 16
  3.3.8 Flow Channel ............................................................ 17
  3.3.9 Bench ................................................................. 17
  3.3.10 Manhole Base .......................................................... 17
  3.3.11 Interior Coatings ....................................................... 18
3.4 Concrete/Grout ................................................................ 18
  3.4.1 General Requirements ................................................... 18
  3.4.2 Concrete ................................................................. 18
  3.4.3 Mortar and Grout ........................................................ 18
3.5 Locating Disk .............................................................. 18
3.6 Marking Tape ............................................................... 18
3.7 Casing Material and Spacers ........................................... 19

SECTION IV – PIPE INSTALLATION & CONSTRUCTION ......................... 20
  4.1 Safety .............................................................................. 20
  4.2 Handling of Materials ..................................................... 20
  4.3 Inspection and Preparation of Pipe and Fittings .................. 20
  4.4 Cutting and Fitting of Pipe ............................................... 20
  4.5 Pipe Alignment and Grade ............................................... 21
  4.6 Temporary Plugs ............................................................. 21
  4.7 Frost .............................................................................. 21
  4.8 Lowering of Material into the Trench ................................. 21
  4.9 Installation of Pipe .......................................................... 22
    4.9.1 General Requirements ................................................. 22
    4.9.2 Ductile Iron Pipe ......................................................... 22
    4.9.3 Polyvinyl Chloride Pipe ............................................... 23
    4.9.4 Yelomine Pipe ............................................................ 23
    4.9.5 Job-Mixed Concrete .................................................... 23
    4.9.6 Ready-Mixed Concrete ............................................... 23
  4.10 Manholes ................................................................. 23
  4.11 Service Lines .............................................................. 24

SECTION V – TESTING AND ACCEPTANCE ........................................... 25
  5.1 General Requirements for Connections ............................ 25
    5.1.1 Service Connections .................................................... 25
    5.1.2 Connections to Manholes ............................................. 25
  5.2 Testing – Sewer Mains ..................................................... 25
    5.2.1 Alignment ............................................................... 25
    5.2.2 Low Pressure Air Testing – General Requirements ........ 25
    5.2.3 Low Pressure Air Testing Procedure ............................ 25
  5.3 Manhole Testing – General Requirements ........................ 27

1.1 Authority
The Standard Specifications for Sewer Mains (the “Specifications”) are promulgated by the Eagle River Water & Sanitation District (“District”). The interpretation and enforcement of the Specifications is hereby delegated to the District Regulations Administrator.

1.2 Effective Date of Specifications
The Specifications shall become effective immediately upon formal adoption by the District and shall supersede all former specifications for sewer main construction. The most current version of these Specifications is available at www.erwsd.org.

1.3 Revisions, Amendments, or Additions
The Specifications may be revised and/or amended. Such revisions, amendments, and additions shall be binding and in full force immediately upon formal adoption by the District.

1.4 Definitions
Please reference the Rules and Regulations for Water and Wastewater Service, Article II.

1.5 Development Approval and Infrastructure Acceptance
Please reference the Rules and Regulations for Water and Wastewater Service, Articles VIII and IX, respectively.

1.6 Variance
The District recognizes that the strict and literal interpretation of these Rules and Regulations may not be possible in all cases. Please refer to Article VII for information on the Variance process.
SECTION II – COLLECTION SYSTEM DESIGN AND LAYOUT

2.1 General Requirements
The District requires an Overall Utility Site Plan of the project to be submitted indicating all utilities and their proposed locations for review prior to Construction Plan Approval. All plans submitted shall include a geotechnical report if requested by the District. The design and installation of all facilities shall ensure development of an integrated collection system.

2.2 Corrosion
Corrosive soils are present in the District’s service area and may lead to the premature degradation of pipe materials and appurtenances. Please refer to Article IX for corrosive soils procedure.

2.2.1 Dissimilar Materials
Cathodic protection and insulation shall be installed as required by the District. Particular care shall be taken to insulate between dissimilar materials.

2.2.2 Insulating Joints
Whenever it is necessary to join pipe of dissimilar metal, or when designated by the District, a method of insulating against the passage of electrical current, approved by the District, shall be provided. Special care shall be exercised during the installation of these joints to prevent electrical conductivity across the joints.

2.3 Sizing Collection Mains
All mains shall be sized to collect and convey estimated peak wastewater flows of the ultimate population of the tributary area to be served. The applicant shall submit a design report prepared by a registered professional engineer that includes projected peak wastewater flow rates at buildout and a hydraulic evaluation of the collection system. Peak design flow rates shall be based on average per capita wastewater generation rates, a peaking factor, and shall include flow from infiltration. Per capita wastewater generation rates, peaking factors, and infiltration rates for hydraulic design will be provided on request by the District’s Engineering Department. The projected peak flows in wastewater mains 12” in diameter or smaller shall convey the flow at a depth of flow no greater than half of the inside diameter of the pipe (depth/Diameter not to exceed 0.50). Peak flows in wastewater mains 15” in diameter or larger shall convey
the flow at a depth of flow no greater than 3/4 of the inside diameter of the pipe (depth/Diameter not to exceed 0.75).

Hydraulic design shall be based upon a Manning’s Formula, using a Roughness Coefficient or ‘n’ value of 0.013. All mains shall be designed to give mean velocities, when flowing full, of not less than two feet per second (2 fps) to insure self-cleaning, and maximum velocities of not more than ten feet per second (10 fps).

The District reserves the right to request oversized mains to provide service for projected future needs. The additional cost for the oversizing may be negotiated between the District and the Applicant and will be reviewed on a case-by-case basis.

2.4 Layout of the Collection System

2.4.1 Easement Width Requirements for Main Installations
All mains shall be installed in dedicated public street right-of-ways or dedicated sewer line easements. The installation of Public Wastewater facilities on developable lots or tracts intended for private use should be avoided to the extent practicable. The standard easement width for all mains shall be a minimum of 20 feet. The main shall be generally centered within the easement. The easement width shall be in accordance with Standard Detail D-09.

2.4.2 Minimum Size
All mains shall be a minimum of eight inches (8") in diameter. All sewer service lines shall be a minimum of four inches (4") in diameter, Refer to Appendix B for Wastewater Service Line Construction Specifications.

2.4.3 Depth of Bury
In general, mains are to be sufficiently deep to receive wastewater from basements and to prevent freezing. The minimum cover above a main shall be four feet six inches (4’- 6”). For every foot of cover that is out of compliance with minimum cover requirements, the District will require the installation of 1-inch of insulation board per Appendix E Section 1.14. In addition to maintaining cover from the ground surface, specified cover is required from storm sewer crossings and other cold air sources. Additional depth may be required to allow for adequate cover on service lines. The Applicant shall demonstrate that the pipe materials are suitable for the proposed depth of installation. Any main installation greater than ten feet (10’) shall require an increased wall thickness. Any proposed main installation greater than 14 feet (14’) shall require an alternatives analysis submittal and District approval.

The maximum depth for a sewer manhole is fourteen feet (14’) and shall be measured from the top of rim to the downstream invert. Any proposed applications with manholes
installed at a depth greater than fourteen feet (14') shall require an alternatives analysis submittal and District approval.

2.4.4 Main Insulation Requirements
For every foot of cover that is out of compliance with minimum cover requirements, the District will require the installation of 1-inch of insulation board per Appendix E Section 1.14. In addition to maintaining cover from the ground surface, specified cover is required from storm sewer crossings and other cold air sources.

2.4.5 Minimum Distance from Structures
All main extensions shall be installed at a minimum distance of ten feet (10') from all structures or at a one foot horizontal to one foot vertical (1:1) ratio from the bottom of any structural element, whichever is greater. Encroachments of structures into easements are discouraged and shall only be allowed by written authorization from the District.

2.4.6 Installations in High Groundwater
Installations in areas of high groundwater, as determined in the soils/geotechnical report, may require the following special provisions and evaluated on a case-by-case basis:

(a) Groundwater barriers, in order to prevent transmission of groundwater along the pipe bedding (See Standard Detail D-07).
(b) Use of C-900 or Yelomine pressure rated piping and joints
(c) Engineered design to prevent floatation of the main due to buoyant forces
(d) High groundwater manholes as identified in 3.3.2

2.5 Slope of Sewer Mains

2.5.1 Minimum Slopes
All sewer shall be designed and constructed to give mean velocities, when flowing full, of 2.0 feet per second or greater, based on Manning’s formula using an “n” value of 0.013. The following are the required minimum slopes for sewer mains 42 inches or less. However, slopes greater than these are desirable. If proposed slopes that are at or near the specified minimum, the District may require an increased slope to control sewer gases and/or to maintain self-cleaning velocities. See Table D-1 Minimum and Maximum Sewer Main Slopes.
2.5.2 Maximum Slopes

The maximum slope allowable in pipeline design will be based upon 10 feet per second maximum velocity. Lined pipes may be able to resist scour at high velocities, however, undue turbulence can become an over-riding design consideration as unacceptable levels of odors may be produced from hydrogen sulfide generation. See Table D-1 Minimum and Maximum Sewer Main Slopes.

Table D-1: Minimum and Maximum Sewer Main Slopes

</tbody>
</table>

2.5.3 Slope between Manholes

A continuous slope shall be maintained on main installations between manholes. Manholes are required at every slope change of the main.

2.5.4 Steep Slope Applications

Steep slope applications with mains longer than 100 feet (100’) are required to install a bar screen manhole at the top of the slope per Detail D-03. Grade breaks shall not be permitted in manholes in excess of ten percent (10%) at the bottom of steep slope applications. Mains shall be anchored securely to the manhole and installed with
restrained joint connections per Detail D-04. Sewer mains with slopes of twenty percent (20%) or greater shall require restrained joints to be designed by the Engineer.

2.5.5 Slope across Manholes

The minimum fall across a standard manhole shall be two-tenths of a foot (0.2’). The hydraulic grade line and energy grade line of flow in a manhole shall be designed to stay below the crown of the pipe.

2.5.6 Main Line Horizontal Alignment

All mains shall be installed with a straight horizontal alignment between manholes.

2.5.7 Length of Mains and Slope Measurement

Length of mains shall be measured horizontally, from the center of manhole structure to the center of the manhole structure, not the center of the manhole lid. Main slopes shall be calculated using the outside invert of the upstream manhole to the outside invert of the downstream manhole. These length and slope calculations shall be used for construction submittals as well as for the Drawings of Record submittal.

2.5.8 Manholes

Manholes shall be installed at the following locations:

(a) The end of each main
(b) All changes in grade, size, horizontal or vertical alignment
(c) Sanitary sewer manholes shall be aligned and spaced so that the change of flow direction is not at an acute angle.
(d) All intersections
(e) Main distances not greater than four-hundred feet (400’)
(f) Manhole lids shall be located outside of the vehicle wheel path on all road installations

Manholes shall not be located in the following areas:

(a) Within ten feet (10’) of domestic water infrastructure
(b) Where surface water can accumulate (ie. drainage pans, ditches, floodplains, etc.)
(c) Within a 100-year floodplain

The manhole access opening shall be a minimum of twenty four inches (24") in diameter. The minimum manhole diameter size shall be based on the largest main penetrating the manhole and adhere to the following:
### Table D-2: Manhole Sizing Criteria

<table>
<thead>
<tr>
<th>Main Diameter</th>
<th>Minimum Manhole Diameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 to 18 inches</td>
<td>48-inch</td>
</tr>
<tr>
<td>21 to 27 inches</td>
<td>60-inch</td>
</tr>
<tr>
<td>30 inches and above</td>
<td>72-inch</td>
</tr>
</tbody>
</table>

Bar screen manholes may be required in new developments to prevent construction debris from entering the collection system. Bar screen manholes shall be required in steep slope applications. Refer to Detail D-03.

Inside Drop manholes shall not be permitted and outside drop manholes will be considered on a case-by-case basis. If a drop manhole is approved, it shall be provided for where a main enters a manhole twenty-four inches (24") or more above the manhole invert. Refer to Standard Detail D-02.

#### 2.5.9 Manhole Clearances

Manholes must be exposed and accessible at all times. A minimum clearance of three (3) feet from the rim of the manhole to the face of any surface obstruction object must be met. The 3 foot minimum must be level. Manholes are not permitted to be in low spots or holes. If the required clearances are not met, ERWSD personnel will remove such obstructions after seven (7) days written notice is given or immediately in cases of emergency, the costs for which may be added as a charge to the property owner’s monthly bill.

#### 2.5.10 Manhole Connections

Any new main connection eight inches (8") or greater within a manhole shall match the crown of pipe to crown of pipe at the highest existing main currently within the manhole.

#### 2.5.11 Location/Marking Tape

All lines connected to District mains in any way shall be marked with the appropriate marking tape per Section 3.6 and shall be placed twenty four inches (24") above the pipe.
2.5.12 Pipe Material

The District requires the same pipe material to be installed from manhole to manhole.

2.5.13 Lift Stations

Lift stations are specifically discouraged. In the event lift stations are approved by the District, they shall be considered Major Facilities and will be designed, constructed and financed by the District in accordance with Article IX.

2.5.14 Maintenance Access

All mains, whether in easements or right-of-way, shall allow for vehicular access to conduct maintenance activities. Access benches shall have a minimum width of twelve feet (12’), a centerline grade of no more than ten percent (10%), and a maximum cross slope of six percent (6%) per Detail D-06. Vehicular turnarounds shall be provided at all dead end mains in conformance with Detail D-08.

2.6 Protection of Potable Water Supplies

When wastewater mains are proposed near any potable water supply facilities, the following requirements of the Colorado Department of Public Health and Environment’s (CDPHE) Potable Water System Design Criterial Manual shall apply:

2.6.1 Cross Connections Prohibited

There shall be no physical connections between a public or private potable water supply system and a main or appurtenance thereto which would permit the passage of any wastewater or polluted water into the potable supply. No water pipe shall pass through or come into contact with any part of a sewer main or manhole. There shall be no physical connections between a stormwater conveyance system and a main or appurtenance thereto which would permit the passage of any storm water into the wastewater collection system. No stormwater water pipe shall pass through or come into contact with any part of a sewer main or manhole.

2.6.2 Relation to Water Works Structures

Minimum distances from public water supply wells or other water supply sources and structures shall be provided.

2.6.3 Horizontal and Vertical Separation from Potable Water Mains

Refer to detail D-11.

(a) Parallel Main Installations and Appurtenances:
Sewer mains and sewer service lines shall be installed at least ten feet (10’) horizontally from any existing or proposed water main. The distance shall be measured edge to edge. In cases where it is not practical to maintain a ten foot (10’) separation, the District may allow installation of the sewer main closer to a water main utilizing encasement or pressure rated joints, provided that the water main is on a separate trench or on an undisturbed earth shelf located on one side of the main and at an elevation so the bottom of the water main is at least eighteen inches (18”) above the top of the sewer main. The District requires a ten-foot (10’) separation between water and sewer appurtenances including manholes. If a manhole is installed, it will be measured from outside of manhole to outside of water attribute.

(b) Perpendicular Crossings – Sewer under Water:

If the sewer pipe crosses under the water main but less than eighteen inches (18”) of clear space will exist, either the water main or sewer main must be installed with secondary containment. Acceptable options include a pipe casing extending no less than nine feet (9’) each side of the crossing. The pipe casing shall be of watertight material with no joints. The casing pipe materials may be steel, ductile iron, fiberglass, fiberglass reinforced polymer mortar (FRPM), or polyvinylchloride (PVC) with suitable carrier pipe supports and casing pipe end seals. Alternatively, concrete or Controlled Low Strength Material (ex. flowable fill) encasement of either pipe extending no less than ten-feet (10’) each side of the crossing may be used.

(c) Perpendicular Crossings – Water under Sewer:

If the sewer pipe will cross above or over the water main, either the sewer pipe or water pipe shall be installed with secondary containment unless the vertical distance exceeds five feet (5’). Acceptable options include a pipe casing extending no less than 9- feet each side of the crossing. The casing must be a single section of steel or ductile iron pipe. The design must include a means to support the interceptor or sewer main to prevent settlement and permit maintenance of the water main without damage to the sewer pipe. Alternatively, concrete or Controlled Low Strength Material (ex. flowable fill) encasement of either pipe extending no less than 10-feet each side of the crossing may be used. Crossings involving jointless pipe such as HDPE, fusible PVE or welded steel do not require installation of secondary containment.
SECTION III – MATERIAL SPECIFICATIONS

3.1 General Requirements
All materials must conform to these Material Specifications and shall be new and undamaged.

Acceptance of materials, or the waiving of inspection thereof, shall in no way relieve the Applicant of the responsibility for furnishing materials that meet the requirements of these Specifications.

3.2 Pipe and Fittings
The following materials are approved for District mains:

3.2.1 Polyvinyl Chloride (PVC) gravity pipe
Main installations from eight to fifteen inches (8" to 15") in diameter shall conform to ASTM D3034, and shall be either SDR-35/PS46 or SDR-26/PS115.

Main installations from eighteen to twenty-seven inches (18" to 27") in diameter shall conform to ASTM F679 and shall be SDR-26/P115. Push on joints and molded rubber gaskets shall conform to ASTM D3212.

Maximum pipe segment lengths shall be twenty feet (20'). Joint lubricant shall be non-toxic and water-soluble and supplied by the pipe manufacturer.

3.2.2 Polyvinyl Chloride (PVC) pressure pipe
(a) Yelomine
Yelomine pipe shall be SDR-21, restrained joint PVC pressure pipe and fittings having a minimum cell classification of 12454 as defined in ASTM D1784 and materials in conformance with ASTM D2241.

(b) C-900
AWWA C-900 pipe may be used for 8 " through 12" diameter pipe, and shall be pressure class 235 psi, DR18, with push-on joints and flexible elastomeric seals ASTM D3139/ASTM F477. All spigot ends shall be beveled to manufacturer’s specifications with gaskets meeting ASTM F477 and joints in compliance with ASTM D3139.
3.2.3 **Ductile Iron Pipe (DIP)**

Ductile Iron Pipe shall be per ASTM A746, Class 52, 350 psi, AWWAC151. Push-on joints shall be ANSI/AWWA C111/A21.11. Factory applied Protecto 401, or equivalent, ceramic epoxy interior lining for DIP & fittings. Manufactured by U.S. Pipe and Foundry Company/Griffin Pipe Products or approved equal.

3.2.4 **Service Line Taps**

Factory wyes shall be used for all service line connections with new main installations. See Appendix B for requirements for new service line connections to existing mains.

3.2.5 **Transition Adapter**

If permitted on a case-by-case basis, Harco transition adapters or Shear Guard couplers may be used for pipe material transitions with prior approval. Fernco couplers shall not be permitted.

3.3 **Manholes**

3.3.1 **Manhole**

Manhole sections, base, riser, conical top sections, flat slab tops, and joint sealants between manhole sections shall be in accordance with ASTM C 478. Concrete used in cast in place-manhole bases shall be per Section 3.3.10. All cone sections shall be the eccentric type. Openings through manhole risers shall be cored or cast-in, and access opening shall be twenty four-inch (24") diameter. Flat lid slabs are required on manholes with a depth of less than five feet (5’) and must be eccentric.

3.3.2 **Water Tightness**

Manholes shall be watertight and constructed of precast concrete. Barrel sections, cones and frame joints shall all be sealed with a double Rub R Nek, or other equivalent material approved by the District. In areas of high groundwater or otherwise required by the District, a bituminous coating, or approved equal waterproofing material, shall be applied to the exterior of the manhole. Manhole vacuum testing shall be required by the District on all manholes in all areas of high groundwater.

3.3.3 **Rings and Covers**

Manhole rings and covers shall be heavy duty castings ASTM A 536 or gray cast iron per ASTM A 48 and all components shall be traffic rated to AASHTO HS-20. Ring and cover combined weight shall be greater than 245 pounds and machined to fit securely with a non-rocking cover. Manhole covers shall be twenty-four inch (24") in diameter and have a minimum of twenty-two and one-eighth inches (22-1/8") diameter clearance, have a waffle pattern with a flat lid and the lettering "SEWER" cast on the cover. Covers
shall be D & L brand model A-1043 or accepted equal. Precision Cover Systems, Inc. (PCSI) fully-adjustable manhole covers with variable grade rings shall be installed in roadways.

### 3.3.4 Grade Rings
Grade rings shall be in accordance with ASTM C 478 and the maximum height of grade rings shall not exceed eleven inches (11").

### 3.3.5 Manhole steps
Steps shall be comprised of grade 60 deformed rebar encased in a polypropylene copolymer plastic with a tread width of fourteen inches (14"). The steps shall be M.A. Industries No. PS2-PF or PS2-PF-DF or approved equal. Steps shall be cast in place during manufacturing of the manhole sections and shall be six inches (6") from face of manhole. The top most step shall be installed between eighteen (18") and twenty-four inches (24") from the rim of the manhole. Manhole steps shall be vertically aligned and plumb. Steps shall be typically spaced at twelve inches on-center vertically with a maximum spacing of sixteen inches (16"). Steps shall not be installed in the "chimney" portion of the manhole. Entry steps shall be located in the barrel and cone sections of the manhole. See Standard Manhole Detail D-01.

### 3.3.6 Joint Sealant
Joints shall be sealed with Rub-R-Nek LTM or approved equal installed on the inner and outer ring. Sealant shall be a flexible gasket-type of Butyl rubber, Federal Specifications SS-S-210 (210-A), per ASTM C990-09, AASHTO M-198 75 1. Sealant shall be applied on all surfaces between precast concrete adjusting ring and casting, individual precast concrete adjusting rings, and precast concrete adjusting ring and cone joints. A compatible primer or solvent as recommended by manufacturer of butyl base material shall be used to prepare surfaces prior to application of butyl base material and riser rings. Two gaskets with a minimum cross sectional area equivalent to one inch (1") in diameter are required per joint on forty-eight inch (48") diameter manholes. Gaskets for manholes greater than forty-eight inches (48") in diameter shall have a minimum cross sectional area of one and one-half inches (1 ½").

### 3.3.7 Pipe to Manhole Seal
KOR-N-Seal, A-Lok, or approved equal flexible rubber boot in a cored hole per ASTM C 923 shall be used for installations in pre-cast bases.
For installations in cast-in-place bases (upon approval and on existing mains only), all pipe-to-manhole connections shall use two elastomeric Kor-N-Seal, or approved equal, “O”-ring water stops minimum per ASTM F477.

### 3.3.8 Flow Channel
The flow channel straight through a manhole should be made to conform as closely as possible in shape and slope to that of the connecting mains and shall have two tenths of a foot (0.2’) minimum fall through the channel for a standard manhole. Channel depth and width shall equal the largest pipe diameter. The channel walls should be formed or shaped to the full height of the crown of the outlet main in such a manner as to not obstruct maintenance, inspection or flow in the sewers.

### 3.3.9 Bench
All manholes shall be constructed with a full bench configuration, in which the top of the invert channel walls shall match the crown of pipe elevation. The horizontal bench surface shall be sloped at a minimum of one-half inch (½”) per foot, maximum of one inch (1”) per foot with a medium broomed finish, perpendicular to the main direction of flow.

### 3.3.10 Manhole Base
The foundation for each manhole base shall be prepared by replacing unsuitable material with sub grade stabilization material in accordance with Appendix E-Earthwork.

The manhole base shall be precast (in accordance with ASTM C478) unless the manhole ties into an existing main, in which case a cast-in-place base may be used. The invert shall be formed and smoothly finished to match the shape and elevation of all pipes connected to the manhole. Where the sewer line is designed with a continuous grade through the manhole, the pipe shall be laid through the manhole location, the top half of the pipe cut out and the manhole base formed around the bottom half of the pipe.

All concrete used in construction of cast-in-place manholes and bases shall be CDOT Class D. Concrete reinforcement shall be epoxy-coated steel reinforcing bars in accordance with ASTM A-615, Grade 60. In instances where a manhole ties into an existing main and a cast-in-place base is used, the first pre-cast manhole section shall be placed on the concrete base structure before the base has taken initial set, or the section shall be grouted into a suitable groove formed in the top of the manhole base. The first section shall be adjusted to the proper grade and alignment so that it is uniformly supported by the base concrete and not bearing on any of the pipes. The manhole steps shall be located one-foot left or right of the main inflow pipe.
The remaining pre-cast sections shall be placed and aligned to provide vertical sides and alignment of the ladder rungs. Plumbness shall be checked as each barrel section is added. A bitumastic or other approved sealer shall be placed between pre-cast sections so that the completed manhole is rigid and watertight. The sealer shall be placed both on the inside lip as well as the outside lip of each section.

3.3.11 Interior Coatings
For drop manholes (or other applications as identified by the District), manhole interiors shall be coated with a Polyamidoamine Epoxy Primer with Polyamidoamine Epoxy Top Coat such as Tnemec Epoxoline Series L69 or equivalent. Preparation and application shall be per manufacturers’ recommendations.

3.4 Concrete/Grout
3.4.1 General Requirements
Contractor shall provide the District Inspector with a specification sheet or mix design from the concrete supplier.

3.4.2 Concrete
All concrete used in construction of cast-in-place manholes and bases shall be CDOT Class D. Construction shall be in conformance with the Detail D-01.

3.4.3 Mortar and Grout
Non-shrink mortar and grout used in the shaping of inverts, grade ring gaps, sealing penetrations, or setting and anchoring cast iron shall consist of one part Type II Portland Cement and two parts of fine, clean sand. Only sufficient water shall be added to provide a stiff, workable cement mixture for proper troweling. Hydrate lime or masonry cement shall not be used. Where relatively thin portions of grout are to be applied (to a flow channel or top of bench) an approved epoxy bonding coat shall be applied to the exposed concrete surfaces prior to grouting.

3.5 Locating Disk
The District will provide green 3M brand Full-Range Disk Marker locating disks to the contractor for stubouts. The contractor shall ensure their correct installation.

3.6 Marking Tape
The installation of green marking tape is required on all sewer mains and service lines. The tape shall be installed approximately 24 inches (24") above the main or line. The tape shall meet the following specifications:
(a) Five (5)-mil thick Polyethylene material.
(b) Solid green color with black lettering.
(c) Six inches (6”) in width.

3.7 Casing Material and Spacers

Carrier pipes to be installed inside casings shall be installed with self-restraining casing spacers. Casing spacers shall provide axial thrust restraint to prevent pipe joint deflection during and after installation. They shall also provide dielectric insulation between the carrier pipe and the casing and facilitate installation of the carrier pipe into the casing. See Sewer Main Casing Detail D-5. Pipe casing shall be smooth wall welded steel ASTM A-53 Grade B cylinder fabricated in accordance with AWWA C200. External loading shall be AASHTO HS-20 highway or E-80 railroad loading, railroad loading plus jacking load. Casing joints shall have ends beveled for field welding, be butt welded with complete joint penetration welds around the entire circumference of the pipe, and be formed and accurately manufactured so that when pipes are placed together and welded they form a continuous casing with a smooth and uniform interior surface. Interlocking joints shall be Permalok Interlocking Pipe Joining System. Casing spacers shall be stainless steel, two piece bolt-on style, minimum fourteen (14) gauge thickness and a minimum length of eleven inch (11”); casing spacers shall be installed every six feet (6’) of the pipeline to support the pipe barrel and the weight of its contents, or at an appropriate spacing as determined by the engineer. The four runners shall be eleven inches (11”) long at a minimum and manufactured of high abrasion resistant, low coefficient of friction, glass filled polymer. Runner heights shall be set to center the carrier pipe in the casing. Risers shall be ten (10) gauge maximum, and the coating shall be fusion-bonded epoxy or heat fused PVC. Casing spacer models shall be Uni-Flange Series UFRCS1300, Advance Products and Systems, Inc. SI-12; Pipeline Seal and Insulator, Inc. C12G or approved equivalent. Restrained casing spacers shall be provided at all pipe joints. Restrained casing spacers shall be Uni-Flange Series UFRCS1390 P or approved equivalent.

Casing end seals shall be preformed and designed to prevent entry of water or loss of material from casing. The end seals shall be made of one-eighth inch (1/8”) thick 60 durometer EPDM or neoprene rubber held together with mastic strips to seal the edges. The seals shall overlap the casing pipe by two inches (2”) and shall be held on with AISI 304L stainless steel worm gear clamps. Casing end seals shall be Advance Products and Systems, Inc. AC or AW; Pipeline Seal and Insulator, Inc. C or W; or approved equivalent.
SECTION IV – PIPE INSTALLATION & CONSTRUCTION

4.1 Safety
Job site safety shall be the responsibility of the contractor. The District Inspector may refuse to enter a jobsite if deemed unsafe by Occupational Health and Safety Act (OSHA) standards. Failure to provide a safe jobsite may prevent the District from conducting an inspection.

4.2 Handling of Materials
Pipe and fittings shall be loaded and unloaded by lifting so as to avoid shock or damage. Under no circumstances shall material be dropped. If, however, any part of the pipe is damaged, the replacement or repair of the damaged pipe shall be done to the satisfaction of the District. Any pipe or fittings that are not acceptable to the District shall be removed from the job site immediately. All pipe-handling equipment and pipe handling methods shall be in accordance with the methods and equipment recommended by the manufacturer.

Under NO circumstance shall forks be inserted into any pipe and or fitting. Pipe shall be stored and handled in accordance with manufacturer’s recommendations. Any pipe with UV degradation or bowing may be rejected by the District Inspector. All pipe shall be delivered to the project site and stored with factory applied end caps intact.

4.3 Inspection and Preparation of Pipe and Fittings
Before placing pipe in the trench, each pipe or fitting shall be thoroughly cleaned of all foreign material, kept clean at all times thereafter, and carefully examined for cracks, warping, or any other defects before installation. Bell ends and spigot ends are to be examined and free of defects. Following the inspection, end caps shall be replaced prior to placing the pipe in the trench.

All lumps, blisters and excess coatings shall be removed from the pipe and fitting, and the outside of the spigot and the inside of the bell shall be wiped clean, dry and free from oil and grease before the pipe or fitting is installed. Dirt and any other material must be removed from the barrel of the pipe before installation.

4.4 Cutting and Fitting of Pipe
Pipe shall be cut in accordance with manufacturer's recommendations, whenever necessary, to conform to location of fittings, line, or grade. All cuts, when required, shall be straight, true and beveled and may be made with plastic pipe cutters or completed per the DIPRA Guidelines for Field Welding and Cutting Ductile Iron Pipe (August 2015).
All burrs shall be removed from the ends of cut pipe and the ends of the pipe lightly rasped or filed.

4.5  Pipe Alignment and Grade
Manholes shall be installed at staked locations and elevations. Main installation stakes for alignment and grade shall be set by a surveyor under the guidance of a Professional Land Surveyor who is registered in the State of Colorado.

Pipe shall be installed at a constant grade from manhole to manhole. No grade breaks or low spots will be accepted. Pipe shall be installed with the bell ends facing in the direction of installation, unless directed otherwise by the District. Where pipe is to be installed on a grade of ten percent (10%) or greater, the installation shall start at the bottom and shall proceed upward with the bell ends of the pipe up grade.

4.6  Temporary Plugs
A mechanical pipe plug shall be used as a temporary plug during line installation to isolate the mainline extension from the existing collection system. All temporary plugs shall be provided by the Contractor.

4.7  Frost
No pipe or appurtenant structure shall be installed upon a foundation into which frost has penetrated, or if at any time there is danger of ice formation. No pipe or appurtenant structure shall be installed unless backfilling can be completed before the formation of ice and frost.

4.8  Lowering of Material into the Trench
Proper implements, tools and facilities satisfactory to the District shall be provided and used by the Contractor for the safe and convenient performance of the work. All pipe, manholes, and accessories shall be carefully lowered into the trench piece by piece by means of suitable tools and equipment, in such a manner as to prevent damage to the materials. Under no circumstances shall the materials be dropped or dumped into the trench.

If damage occurs to any pipe, manholes or main accessories in handling, the District inspector may reject the damaged material at the discretion of the inspector.
4.9 Installation of Pipe

4.9.1 General Requirements

Factory applied end caps shall remain installed on the pipe while it is being placed in the trench to prevent foreign material from entering the pipe. The end cap shall be left in place until the connection is to be made to the adjacent pipe. During installation, no debris, tools, clothing or other foreign materials shall be placed in the pipe.

As each length of pipe is placed in the trench, the spigot end shall be centered in the bell and the pipe inserted to the manufacturer’s recommended depth with a slow steady pressure without jerky or jolting movements and brought to correct line and grade. The pipe shall be secured in place with bedding material tamped under it, except at the bells. Precautions shall be taken to prevent dirt from entering the joint space. No wooden blocking shall be left at any point under the pipeline. All pipe joints shall be uniform and smooth transitions shall exist from joint to joint or fitting. See Appendix E for bedding, backfill and compaction requirements.

4.9.2 Ductile Iron Pipe

Push-On Joints: The inside of the bell, the outside of the spigot end, and the rubber gasket shall be thoroughly cleaned to remove oil, grit, excess coating, and other foreign matter. The rubber gasket shall be flexed inward and inserted into the gasket recess of the bell socket. NSF-61 approved gasket lubricant per the manufacturers recommendations shall be applied to either the inside face of the gasket, and the spigot end of the pipe, per the manufacturer's recommendations.

The spigot end of the pipe shall be placed in the bell end with care to prevent the joint from contacting the ground. Pipe furnished without a depth mark on the spigot end shall be marked before assembly to ensure insertion to the manufacturer’s recommended depth. The pipe shall be kept in straight alignment and the joint shall be completed by inserting the pipe to the manufacturer’s recommended depth with a slow, steady pressure by using a long pry bar, jack, lever puller, or backhoe bucket. A timber header should be used between the pipe and the jack or backhoe bucket to avoid damage to the pipe.

Upon completion of joining push-on joint pipe, an inspection shall be made to ensure that the gasket is correctly aligned in the gasket recess of the bell socket and not twisted or turned.
4.9.3 Polyvinyl Chloride Pipe

Elastomeric Gasket Joints: Immediately before joining two (2) lengths of PVC pipe, the inside of the bell or coupling, the outside of the spigot and the elastomeric gasket shall be thoroughly cleaned to remove all foreign material.

Lubrication of the joint and rubber gasket shall be done in accordance with the pipe manufacturer’s specifications.

Care shall be taken that the correct elastomeric gasket, compatible with the annular groove of the bell, is used. Insertion of the elastomeric gasket in the annular groove of the bell or coupling must be in accordance with the manufacturer's recommendations.

The spigot and bell or coupling shall be aligned and inserted to the manufacturer’s recommended depth or reference line. Installation or pushing shall be done in a smooth, steady motion. Upon completion of joining the pipe, an inspection shall be made to assure that the gasket is correctly aligned in the gasket recess of the bell socket and not twisted or turned. NO deflection will be allowed at a joint of PVC pipe.

4.9.4 Yelomine Pipe

Installation of Yelomine pipe shall be in accordance with the manufacturer's recommendations and specifications. Cleanout caps shall be installed with non-permanent gaskets where applicable.

4.9.5 Job-Mixed Concrete

Job-mixed concrete shall be thoroughly mixed to combine aggregates, cement, and water into a uniform mass.

4.9.6 Ready-Mixed Concrete

Said materials must be proportioned, mixed and transported in accordance with ASTM C94. Any concrete not plastic and workable when it reaches project shall be rejected. See Section 3.4 for material specifications.

4.10 Manholes

Manholes shall be precast, watertight and constructed in accordance with the District's standard details and per Section 3.3. For precast manhole bases, the area underneath the manhole base shall be excavated and bedding material shall be placed and compacted to the required elevation. The manhole base shall then be lowered into the trench and checked for proper bearing on the subgrade, proper elevation and orientation to receive the incoming and outgoing sewers at the designated invert.
SECTION IV – PIPE INSTALLATION AND CONSTRUCTION

elevation. If the invert elevation varies by more than plus or minus one half inch (1/2")
from the designated invert elevation, the base shall be removed and reset. The concrete
invert channel and bench shall be constructed following the connection of all sewer
pipes to the manhole. The flow channel shall be smooth and true to the sewer pipe
invert elevations, with uniform cross section and slope, either straight or with a
continuous curve between inlet and outlet of pipes. To eliminate free fall conditions in a
manhole resulting from invert elevation differentials between incoming and outgoing
pipes, the Contractor shall form and construct suitable channels in the bottom of the
manhole connecting the inverts. Shape channel base and bench per Sections 3.3.8 and
3.3.9, respectively. New manholes shall have pre-formed holes for pipe installation and
existing manholes shall be cored to install pipe and connector. Chip existing concrete
bench inside manhole and shape smooth continuous invert for connections to existing
manholes. All pipe-to-manhole connections and grade adjustment rings shall be sealed
and grouted with non-shrink materials and be watertight. All lift holes shall be filled with
non-shrink grout.

All dimensions, locations and elevations shall be coordinated by the Applicant and
Contractor and meet the requirements of the District. Cast-in-place manhole bases will
only be allowed when connecting to an existing main.

4.11 Service Lines
Refer to Appendix B, Section II.
SECTION V – TESTING AND ACCEPTANCE

5.1 General Requirements for Connections

Connections to the District system shall be inspected and approved by the District prior to backfilling.

5.1.1 Service Connections

Refer to Appendix B.

5.1.2 Connections to Manholes

All connections shall match the crown of pipe to crown of pipe at the highest existing main or per the direction of the District. All new main installations shall require reformed benches that meet all District standards.

5.2 Testing – Sewer Mains

5.2.1 Alignment

Straight alignment shall be checked by using either a laser beam or lamping.

5.2.2 Low Pressure Air Testing – General Requirements

The air test shall, as a minimum, conform to the test procedure described in ASTM F 1417 Standard Practice for Installation Acceptance of Plastic Non-Pressure Sewer Lines Using Low-Pressure Air. Deflection testing should occur prior to air test.

5.2.3 Low Pressure Air Testing Procedure

(a) Lines must be cleaned by flushing or by other means before the low pressure air test is to begin.

(b) Isolate the sewer line to be tested and ensure that all other outlets from which air could escape are properly sealed. In this step of the procedure, it is necessary to inspect the manhole invert being plugged to be sure that it has no damage which will be covered by the plug and not detected with the low-pressure air test.

(c) Determine the duration of the test by using the accompanying tables at the end of this section.
(d) Begin the test by connecting the air source to the inlet tap. Slowly add air until the internal pressure of the test section reaches a pressure 4.0 psig. If ground water back pressure exists, it must be quantified by the Engineer prior to testing.

(e) After the constant pressure of 4.0 psig is obtained, regulate the air supply so that the pressure is maintained between 3.5 to 4.0 psig for at least 2 min. Depending on air/ground temperature conditions, the internal air temperature will stabilize in equilibrium with the temperature of the pipe walls. The pressure will normally drop slightly until equilibrium is obtained; however, a minimum of 3.5 psig is required.

(f) Once the pressure has stabilized to 4.0 psig (plus the average ground water back pressure, if applicable) disconnect the air supply from the control panel. Observe the continuous monitoring gauge and decrease the internal pressure to no less than 3.5 psig. At a reading of 3.5 psig or within the range of 3.5 to 4.0 psig, stop decreasing the pressure and commence timing with a stopwatch or watch with a second hand or digital readout in minutes and seconds with an accuracy of 0.1 s.

(g) Once the predetermined time period from the formula or table above has elapsed, observe the continuous monitoring gauge to obtain the amount of pressure lost during the test duration. If the pressure drop is found to be less than 1.0 psig (or 0.5 psig in circumstances where a shorter test duration is desired), the section is presumed to be free of any leaks or defective joints. If the pressure drop is 1.0 psig or greater (0.5 psig or greater in circumstances where a shorter test duration is desired), the test section has failed due to excessive pressure loss. When low-pressure air testing of a sewer line results in a failure the Contractor, at his/her own expense, shall detect the leak or defect and repair or replace whatever is necessary to remedy such defect in a manner acceptable to the Owner.

### Table D-3: Minimum Time for a 1.0 psig Pressure Drop for Size and Length of Pipe for $Q = 0.0015$

**NOTE 1**—See Practice UNI-B-6.

**NOTE 2**—Consult with pipe and appurtenance manufacturer for maximum test pressure for pipe size greater than 30 in. in diameter.
5.3 Manhole Testing – General Requirements

Manhole vacuum testing shall be required by the District on all manholes in all areas of high groundwater via the vacuum test per ASTM C1244, “Standard Test Method for Concrete Sewer Manholes by the Negative Air Pressure (Vacuum) prior to backfill.

5.3.1 Manhole Testing Procedure

(a) Plug all inlets and outlets.

(b) Install the vacuum tester head assembly on the manhole.

(c) Attach the vacuum pump assembly to the proper connection on the test head assembly. Make sure the vacuum inlet/outlet valve is in the closed position.

(d) Inflate the sealing element to twice the test pressure to be used. Do not over inflate.

(e) Start the vacuum pump assembly engine and allow preset RPMs to stabilize.

(f) Open the inlet/outlet ball valve and evacuate the manhole to ten-inch (10") Hg (mercury) that is equivalent to approximately 5 PSIG (0.3 bar) backpressure.

(g) Close the vacuum inlet/outlet ball valve, disconnect the vacuum pump and monitor the vacuum for one (1) minute.

(h) Allowable leakage - less than one-inch (1") Mercury (Hg) in one (1) minute.

(i) All manholes that do not meet the minimum amount for the leakage rests must be repaired and re-tested.
5.4 Television Inspection – General Requirements

Prior to construction/final acceptance of any sanitary sewer line by the District, the main shall be inspected internally by television as outlined in this Section. Leakage testing shall be performed prior to televising. The complete job is ready for television inspection when the following work has been completed.

(a) All sewer pipelines are installed and backfilled.
(b) All attributes are in place, all inverts are complete and pipelines are accessible.
(c) All other underground facilities, utility piping and conduits are installed.
(d) Pipelines have been jet cleaned.
(e) Final air test has been completed.

When the above work is complete, the Contractor shall arrange for the television inspection. The Contractor of the project will notify the District in writing as to the scheduled date of the television inspection.

After conditions a through e as outlined above, are met, the entire job will be televised.

(a) A video, accompanied by Standard Form 6.3 shall document defects requiring correction.
(b) If no deficiencies are observed, the work will be considered satisfactory.

There is no acceptance tolerance for defects such as high and low spots, joint separations, offset joints, chipped ends, cracked or damaged pipe, dimples or bumps in the pipe, or groundwater infiltration.

5.4.1 Inspection Format

Sanitary sewer lines shall be inspected by means of remote CCTV. All CCTV work shall conform to current NASSCO-PACP standards. Contractor shall provide the District with CCTV inspections (video and data collected) entirely in electronic format. Mains shall be tested with three and a half (3.5) gallons of water per minute flowing during televising and shall follow the direction of flow. The camera must be centered in the pipe and the speed of travel shall be slow enough to inspect each pipe joint, and tee connection, and should not, at any time, be faster than 30 feet per minute.

The documentation of the work shall consist of PACP CCTV Reports, PACP database, logs, electronic reports, etc. noting important features encountered during the inspection. All CCTV video observations shall be identified by audio and recorded on the District Standard Form 6.3 and is required to accompany each submittal.
5.4.2 CCTV Video Content
Submitted CCTV videos shall include:

(a) Footage indicator
(b) Running time
(c) Date
(d) Location
(e) Beginning (upstream) and ending (downstream) manhole numbers for each run. Manhole numbers corresponding with the District’s GIS mapping system shall be obtained by the District field inspector.

5.4.3 District Review
The Contractor will be notified in writing of any deficiencies revealed by the television inspection that require repair. If corrective work is indicated and the Contractor wishes to view CCTV videos, he shall contact the District to set a time for the viewing.

5.4.4 Correction of Deficiencies
Those segments of the pipeline system that have been corrected must be re-televised. The procedure outlined in above will be repeated until all deficiencies observed by television inspection have been corrected to the complete satisfaction of the District. Prior to submittal to the District, the CCTV videos shall be reviewed by the Engineer, Applicant, and Contractor for any defect that may be visible. If CCTV videos and cut sheets are submitted to the District that are deemed "unacceptable," the Contractor shall be charged for the time taken by District personnel to review the CCTV videos. The minimum charge shall be one hundred dollars ($100).

5.5 Sewer Main Repairs
All proposed repairs must be approved by the District Inspector prior to actual repair. Once repair has been made, inspection will be required by a District Inspector. There will be no exception to this requirement. If a repair and/or correction is made in a sewer line segment, the entire line segment shall be required to be re-televised with water flowing. A line segment is defined as the entire length of sewer line from manhole to manhole.

5.6 Protection of Existing Sewer System
On the outlet of the connection point to the existing District sewer main, a mechanical plug shall be installed to prevent any flow, debris and or material from the newly constructed main line from entering the District's system. The plug shall be normally set on the downstream outlet of the manhole. Plugs shall be installed per the direction of
the District's Inspector. The plug shall be a mechanical-type device and is to be secured to the existing manhole to prevent loss of plug. The plug shall not be removed until Construction Acceptance has occurred.

The Contractor shall be required to make routine inspections of the mechanical plug to insure that no leaking is occurring. If a leak is found, the Contractor shall immediately notify the District and take corrective action.

The District may perform a video inspection of existing sewer mains that could potentially be impacted by construction activities prior to the start of construction and after the completion of construction. Any damage to existing facilities caused by the Contractor shall be repaired at the Contractor’s expense.

5.7 Manhole Abandonment

Manholes to be abandoned in place shall have all pipes entering or exiting the structure plugged with lean concrete or controlled low strength material backfill (Flo-Fill). For manholes with existing pipes too large to plug with fill, a bulkhead shall be constructed on the inside of the manhole to prevent the fill from entering the pipes.

Manhole tops or cone section shall be removed to the top of the full barrel diameter section or to a point not less than eighteen (18) inches below final grade. The structure shall then be backfilled with lean concrete or Flo-Fill. Surface restoration shall be completed to match the surrounding areas.
SECTION VI – FORMS

Form 6.1: Pre-Construction Meeting Checklist for Sewer Main Installation

Form 6.2: Sewer System Acceptance Procedure

Form 6.3: Flushing and Televising Cut Sheet

Form 6.4: Bill of Sale – Sewer Main

Form 6.5: Sewer Easement

Form 6.6: Lender’s Consent

D-01: Standard Manhole

D-02: Drop Manhole

D-03: Bar Screen Manhole

D-04: Anchor Manhole

D-05: Casing Detail

D-06: Sewer Maintenance Access

D-07: Groundwater Barrier

D-08: Arm Design Turnaround

D-09: Easement Width Detail

D-10: Sewer Pipe Installation

D-11: Water and Sanitary Sewer Separation
FORM 6.1 Pre-Construction Meeting Checklist for Sewer Main Installation

Project: ____________________________ Location: ____________________________

Date: ________________ Wastewater Plant: ____________________________

Attendees: __________________________________________________________

☐ 1. Customer Notification

☐ 2. All licenses and permits are secured for work.

☐ 3. A bill of materials has been provided and reviewed.

☐ 4. Site Safety
  ✓ OSHA safety standards and practices apply.

☐ 5. Survey
  ✓ Survey layout is complete and surveyor retained for as-built locations.

☐ 6. Temporary Plugs
  ✓ A mechanical pipe plug must be installed where new mains are connected to existing mains. This plug will remain until the district inspector approves removal.

☐ 7. Installation of Pipe
  ✓ Factory applied end caps will remain on the pipe until connection is made.
  ✓ Check all pipes for warping. Any pipe considered to be warped will be rejected.
  ✓ No “low” areas, pipe defects, dents, cracks or wide joints will be allowed.
  ✓ All mains and services in proximity to potable water infrastructure will meet district regulations pertaining to separation of services.

☐ 8. Minimum Depth of Bury and Bedding
  ✓ Four-feet six inches (4'-6”)
  ✓ In cases where minimum bury depth cannot be achieved, one inch (1”) of approved insulation will be required per foot of missing cover, minimum 2 inches.
  ✓ Six inches (6”) of approved bedding material under the pipe and twelve inches (12”) over the top of pipe.
9. Cutting of Pipe
- All cuts will be straight, true and beveled. All burrs will be removed from the ends of cut pipe and the ends lightly rasped or filed.

10. Manholes
- All manhole sections to be pre-cast except for tie-ins to existing segments.
- All manhole sections must be centered and have Rub-R-Neck gaskets on both inner and outer rings.
- All manhole inverts must be grouted to meet pipe (no standing water), all benches and flow channels must be formed and clean.

11. Marking Tape and Locating Disk
- Marking tape will be placed twenty-four inches (24") above the pipe for all main and service lines. Marking tape shall be solid green color with black lettering six inches (6") wide and of five (5)-mil thick PVC material.
- A 3M disk marker will be placed at all service ends with a maximum four foot (4’) bury from finish grade

12. Testing
- All mains will be air tested.
- High groundwater manholes will be vacuum tested.
- All mains will be cleaned and televised, original videos and cut sheets will be submitted to the District in the required format. All videos must be reviewed for deficiencies by the owner/contractor/engineer prior to submittal to the District. Additionally, all corrective action taken by the owner/contractor/engineer will be completed, inspected by the District, and re-televised prior to initial submittal to the District.

13. Stub Outs
- Stub outs will be only allowed to the edge of easement or the property line.

14. Design Changes
- Engineer must submit any design changes to Construction Review for approval prior to implementation. Minor field changes may be approved by the District inspector and captured in As-Built documentation.

15. Construction acceptance includes the following:
- Rough grade inspection
- Manhole inspection
- Air testing, cleaning, televising completed and approved.
- Drawings of record submitted and approved.
- Easement documentation.
- Project costs.
- Bill of sale.
☐ 16. Warranty Period

✓ Will not start until Drawings of Record, Recorded Easement Documents, Project Costs Documents and Bill of Sale are received and approved by the District

General Comments: ____________________________________________________________
__________________________________________________________________________
__________________________________________________________________________
__________________________________________________________________________
KNOW ALL MEN BY THESE PRESENTS, that __________________________, ("Seller"), for and in consideration of the mutual promises and assurances made herein, the sufficiency of which is hereby acknowledged, and other valuable consideration to be paid by EAGLE RIVER WATER & SANITATION DISTRICT, a quasi-municipal corporation of the State of Colorado ("District"), has bargained and sold, and by these presents does grant and convey unto the District, its successors and assigns, the following property:

The sewer system, equipment, and related appurtenances and facilities, including all related personal property (the “Improvements”), which are constructed or otherwise acquired by Seller within the property generally known as __________________________ __________________________, and described on Exhibit A, attached hereto and incorporated herein by reference.

To have and to hold the same, unto the District, its successors and assigns forever, and Seller, for itself, its successors and assigns, covenants and agrees to and with the District, its successors and assigns, to warrant and defend the sale of said Improvements, hereby made unto the District, its successors and assigns, against all and every person or persons whomsoever, and warrants that the conveyance of the Improvements to the District, its successors and assigns, is made free from any claim or demand whatsoever.

The Seller further agrees and assures:

1. That all of the Improvements described herein were installed in substantial compliance with the District’s Rules and Regulations and applicable construction standards, and that said Improvements are in first-class working order, free from any defect whatever.

2. That no charges for materials or labor are due and payable on any of the Improvements described herein, and that Seller shall indemnify, defend, and hold the District and its agents, employees, engineers, and attorneys, harmless from and against all claims, damages, judgments, losses, and expenses of every nature, including reasonable attorney’s fees, arising at any time out of any act or omission of Seller and its employees, subcontractors and their employees, and all other persons directly or indirectly involved or performing work for Seller on the Improvements described herein.

3. If within two (2) years after the date of Construction Acceptance of the Improvements by the District, any Work is found to be defective, Seller shall promptly, without cost to the District and in accordance with the District’s written instructions, within seven (7) days after the District’s issuance of written instructions correct the defective Work at Seller’s cost. If Seller does not promptly comply with the terms of such instructions or in an emergency where delay would cause serious risk of loss or damage, the District may have the defective Work corrected or removed and replaced,
and all direct and indirect costs of such removal and replacement, including compensation for additional professional services, shall be paid by Seller. Seller shall also pay for any damage done to other work, other property or persons that occurred as a result of the defective Work within the TWO-YEAR warranty period.

4. Except for any notice required by law to be given in another manner, (a) any notice to Seller provided for in this Bill of Sale shall be in writing and shall be given and be effective upon (1) delivery to Seller or (2) mailing such notice by first class U.S. mail, addressed to Seller to Seller's address stated herein or at such other address as Seller may designate by notice to the District and (b) any notice to the District shall be in writing and shall be given and be effective upon (1) delivery to the District or (2) mailing such notice by first class U.S. mail, to the District’s address stated herein or to such other address as the District may designate by notice.

IN WITNESS WHEREOF, the Seller has caused its name to be hereunto subscribed this ______ day of ________________, 20__.

FORM 6.5 SEWER EASEMENT

SEWER EASEMENT

THIS EASEMENT is made this ______ day of _________________, 20__, by and between ___________________________________________________ (hereinafter referred to as “Grantor”), ______ successors and assigns, and ________________________________ DISTRICT, a quasi-municipal corporation of the State of Colorado within the County of__________, (hereinafter referred to as “District”).

WITNESSETH, that for and in consideration of the sum of One Dollar ($1.00) and other good and valuable consideration paid by the District to Grantor, the receipt of which is hereby acknowledged, the Grantor does hereby grant, convey and transfer unto the District, its successors and assigns, a perpetual easement and right to construct, install, remove, replace, add to, maintain, repair, operate, change or alter underground sewer lines and all underground and surface appurtenances related thereto such as lift stations and manholes (hereinafter “sewer lines”), together with any and all sewer lines situate therein, all necessary rights-of-way for convenient ingress and egress thereto and the right to occupy and use, from time to time, as much of the adjoining land of the Grantor as may be reasonably necessary for any of the aforesaid purposes, over, under and across the following described premises, situate in the County of _____________ , State of Colorado, to-wit:

See EXHIBIT A attached hereto and incorporated herein by reference.

Grantor warrants that the Grantor has the lawful right to grant and convey such easement, rights-of-way, and sewer lines. Further, Grantor warrants that the sewer lines are free and clear of all liens and encumbrances.

Grantor will at no time permit, place or construct any structure, building or improvement of any kind, temporary or permanent, on any part of the above-described premises. Any structure, building or improvement located on the above-described premises as of the date of this Easement, may be removed by the District without liability for damages arising therefrom.

Following the completion of the purpose of any entry by the District upon such easement for any of the aforesaid objects, the District shall restore the premises to substantially the same condition existing at the time of the entry thereon, except for shrubs, plants, sidewalks, driveways or parking areas thereon located or damaged thereby.

All provisions of the Easement, including all benefits and burdens, shall run with the land and shall be binding upon and inure to the benefit of the successors and assigns of the parties hereto, subject to the provisions hereof.
IN WITNESS WHEREOF, the parties hereto have set their hands and seal the day and year first above written.

GRANTOR:

(Name of Grantor)

GENERAL NOTES
1. ALL CONCRETE WORK SHALL COMPLY WITH LATEST ACI-318 SPECIFICATIONS.
2. MANHOLE TROUGH SHALL HAVE A MINIMUM OF 0.2' DROP FROM ENTRANCE THROUGH EXIT.
3. FLOW CHANNEL TO BE SHAPED AS TO NOT ALLOW STANDING WATER PER 3.3.8.
4. MANHOLE SHALL CONFORM TO ASTM C478 AND ALL APPLICABLE DISTRICT STANDARDS (APPENDIX D).

STANDARD MANHOLE

DRAWN BY: JEC DATE: 03/01/2017
SCALE: NONE REV: N/A

846 FOREST ROAD VAIL, CO 81657 (970) 476-7480
WWW.ERWS.D.ORG

D-01
GENERAL NOTES

1. SEE 2.4.12 AND 3.3.11.

2. MANHOLE SHALL CONFORM TO D-01 STANDARD MANHOLE DETAIL AND ALL APPLICABLE DISTRICT STANDARDS.

3. ALL CONCRETE WORK SHALL COMPLY WITH LATEST ACI-318 SPECIFICATIONS.

4. MANHOLE TROUGH SHALL HAVE A MINIMUM OF 0.20’ DROP FROM ENTRANCE THROUGH EXIT.

EAGLE RIVER WATER & SANITATION DISTRICT
846 FOREST ROAD
VAL, CO 81657
(970) 476-7480
WWW.ERWSD.ORG

DROP MANHOLE CONNECTION

DRAWN BY: JEC  DATE: 03/01/2017
SCALE: NONE  REV: N/A

D-02
GENERAL NOTES

1. 5' DIAMETER MANHOLES SHALL BE ALLOWED FOR STRAIGHT THROUGH BAR SCREENS. SLOPE TO BE 0.25' MIN.

2. 6' MANHOLES SHALL BE REQUIRED FOR 3-WAY AND/OR CHANGES OF DIRECTION. SLOPE TO BE 0.30' MIN.

3. BAR SCREEN CHANNEL AND BENCH TO BE HAND SHAPED AND GRADED BY CONTRACTOR PER 3.3.8 AND 3.3.9. APPENDIX D.

4. ALL HARDWARE FOR BAR SCREEN SHALL BE 316 STAINLESS STEEL.

5. ALLOW CLEARANCE FOR BAR SCREEN TO SWING UP FOR CLEANING.

6. CONCRETE BENCH FROM INLET TO OUTLET TO BE EQUAL TO PIPE DIAMETER. FORM A BENCH TO SLOPE UP AT 5% TO WALLS OF MANHOLE AS REQUIRED FOR A STANDARD MANHOLE.

7. FORM A 2' SUB-BENCH ON EITHER SIDE OF CHANNEL AND FOLLOW SAME SLOPE AS BAR SCREEN. EMBED 1-1/2" X 1-1/2" X 1/4" ANGLES ALONG THIS BENCH FOR REST. 

BAR SCREEN TO BE 24" LONG AND THE WIDTH IS TO BE DIAMETER OF PIPE + 4". 1-1/2" X 1/4" STOCK SHALL FORM THE LONG AXIS OF THE SCREEN AND 3/8" ROD SHALL FORM THE BARS.
GENERAL NOTES

1. Anchor manholes are required where pipe slope exceeds 20% exiting the manhole only. Per Appendix D.

2. Sewer mains on 20 percent slopes or greater shall be anchored securely with concrete anchors spaced as follows:
   a. Not over 36 feet center to center on grades 20 percent and up to 35 percent
   b. Not over 24 feet center to center on grades 35 percent and up to 50 percent
   c. Not over 16 feet center to center on grades 50 percent and over.
GENERAL NOTES

1. FOLLOW MANUFACTURER'S RECOMMENDATION, IF IN CONFLICT WITH ERWSD STANDARDS, USE MORE RESTRICTIVE SPECIFICATION.

2. CARRIER PIPE SHALL BE CENTERED AND ALL JOINTS RESTRAINED IN & THROUGH THE CASING PIPE.

3. SEWER MAINS SHALL BE ENCASED SEPARATELY FROM OTHER UTILITIES.

4. ALL FASTENERS SHALL BE T-304 STAINLESS STEEL.

5. MAXIMUM DISTANCE BETWEEN SPACERS SHALL BE 6 FEET ON CENTER.

CONSTRUCT HAMMERHEAD OR 90° SIDEARM TURNAROUND AT THE END OF ALL DEAD END SEWER LINES. SEE STANDARD DETAIL D-08

GENERAL NOTES:

1. THE CONTRACTOR SHALL GRADE ALL OFF ROAD SEWER LINE TRENCHES TO PROVIDE ACCESS PLATFORM.

2. ACCESS PLATFORMS SHALL BE GRADED TO MATCH ROAD GRADES TO PROVIDE VEHICULAR ACCESS AT ALL ROAD AND PLATFORM INTERSECTIONS. MAXIMUM GRADE FOR BACK LOT ACCESS SHALL BE 10%.

3. ALL EARTHWORK SHALL BE IN CONFORMANCE WITH APPENDIX E.

4. TOPSOIL, BLANKET AND REVEGETATE ALL DISTURBED AREAS.
CLAY MATERIAL (GC/SC/SL) PLASTICITY INDEX OF 10 AND MIN. 70% PASSING 200 SIEVE COMPACTED TO 95% STANDARD PROCTOR OR FLOW FILL.

SCALE: NONE REV: N/A

848 FOREST ROAD VAIL, CO 81657 (970) 476-7480
WWW.ERWSD.ORG D-07
GENERAL NOTES

1. DIMENSIONS INDICATE REQUIRED USEABLE PLATFORM AND DO NOT INCLUDE CUT OR FILL SLOPES.

2. 90° ARM CAN BE EITHER RIGHT OR LEFT SIDE.

3. TURN AROUNDS MAY BE INSTALLED AS TERRAIN DICTATES AND AS APPROVED BY THE DISTRICT.

4. BACK LOT MAINTENANCE ACCESS & TURNAROUNDS MUST BE ENTIRELY LOCATED WITHIN DEDICATED EASEMENTS.
### General Notes

1. PIPE SHALL BE CENTERED IN EASEMENT.

2. ANY PROPOSED SEWER MAIN DEPTH GREATER THAN 14’ DEEP REQUIRES AN ALTERNATIVES ANALYSIS AND DISTRICT APPROVAL.

3. CALCULATE EASEMENT WIDTH AS FOLLOWS:
   \[ W = \text{DEPTH TO TOP OF PIPE} \times 2 + 3 \text{ FEET} \]
   (ROUNDED UP IN 5 FOOT INCREMENTS)

**Example:**
- 10 FOOT DEEP PIPE = 10 X 2 + 3 = 23 FEET
- \( W = 25 \) FOOT WIDE EASEMENT ROUNDED

WWW.ERWSD.ORG

**EASEMENT WIDTH DETAIL**

DRAWN BY: JEC DATE: 03/01/2017

SCALE: NONE REV: N/A

D-09
GENERAL NOTES

1. CONDITION OF LESS THAN MINIMUM BURY DEPTH IS ALLOWED ONLY WITH WRITTEN APPROVAL FROM THE DISTRICT PRIOR TO CONSTRUCTION. INSULATION SHALL BE INSTALLED ON ALL PIPE THAT DOES NOT MEET MINIMUM BURY REQUIREMENTS.

2. THE USE OF INSULATION MUST BE APPROVED BY THE DISTRICT PRIOR TO INSTALLATION.

3. INSULATION SHALL BE INSTALLED ON ALL PIPES THAT DO NOT HAVE A MINIMUM OF 4.5' OF EFFECTIVE COVER. EFFECTIVE COVER SHALL BE DEFINED AS SEPARATION FROM COLD AIR SOURCES INCLUDING STORM SEWERS. 1' OF INSULATION BOARD MAY BE SUBSTITUTED FOR EACH 1' OF SOIL COVER (MINIMUM 2' OF INSULATION) REQUIRED TO MEET THE MINIMUM COVER REQUIREMENT.

4. INSULATION SHALL BE DOW HIGHLOAD 100, OWENS CORNING FOAMULAR 1000, OR APPROVED EQUAL. HIGH COMPRESSIVE STRENGTH FOAM BOARD INSULATION IS REQUIRED WITHIN ALL RIGHT OF WAY AND PAVED AREAS.
WATER MAINS MUST BE LAID AT LEAST 10 FEET HORIZONTALLY FROM ANY EXISTING OR PROPOSED GRAVITY SANITARY OR STORM SEWER, SEPTIC TANK, OR SUBSOIL TREATMENT SYSTEM. THE DISTANCE MUST BE MEASURED EDGE TO EDGE.

REQUIRED SEPARATION FOR PARALLEL INSTALLATIONS

18" VERTICAL SEPARATION IS REQUIRED. THE WATER MAIN SHALL BE LAID IN A SEPARATE TRENCH OR ON AN UNDISTURBED EARTH SHELF LOCATED ON ONE SIDE OF THE SEWER AT SUCH AN ELEVATION THAT THE BOTTOM OF THE WATER MAIN IS AT LEAST 18 INCHES ABOVE THE TOP OF THE GRAVITY SEWER.

EXCEPTION—REQUIRED SEPARATION FOR PARALLEL INSTALLATION CAN NOT BE ACHIEVED

GENERAL NOTES

1. WATER PIPES MUST NOT PASS THROUGH OR COME IN CONTACT WITH ANY PART OF A SEWER MANHOLE. WATER MAIN SHOULD BE LOCATED AT LEAST 10 FEET FROM SEWER MANHOLES.

2. PIPE SEPARATION MUST COMPLY WITH STATE OF COLORADO DESIGN CRITERIA FOR POTABLE WATER SYSTEMS, SECTION 8.8 (ALL DETAILS REGARDING SEPARATION BETWEEN WATER AND SEWER).

3. SECONDARY CONTAINMENT—THE PIPE CASING MUST BE OF WATER-TIGHT MATERIAL WITH NO JOINTS. THE CASING PIPE MATERIALS MAY BE STEEL, DUCTILE IRON, FIBERGLASS, FIBERGLASS REINFORCED POLYMER MORTAR (FRPM), OR POLYVINYLCHLORIDE (PVC) WITH SUITABLE CARRIER PIPE SUPPORTS AND CASING PIPE END SEALS.

4. SECONDARY CONTAINMENT REQUIRED UNLESS THE VERTICAL DISTANCE EXCEEDS 5 FEET. THE CASING MUST BE A SINGLE SECTION OF STEEL OR DUCTILE IRON PIPE. THE DESIGN MUST INCLUDE A MEANS TO SUPPORT THE INTERCEPTOR OR SEWER MAIN TO PREVENT SETTLEMENT AND PERMIT MAINTENANCE OF THE WATER MAIN WITHOUT DAMAGE TO THE SEWER PIPE CROSSINGS INVOLVING JOINTLESS PIPE SUCH AS HOPE, FUSIBLE PVC OR WELDED STEEL DO NOT REQUIRE INSTALLATION OF SECONDARY CONTAINMENT.

WATER MAINS CROSSING SEWERS MUST BE LAID TO PROVIDE A MINIMUM VERTICAL DISTANCE OF 18 INCHES BETWEEN THE OUTSIDE OF THE WATER MAIN AND THE OUTSIDE OF THE SEWER. THIS MUST BE THE CASE WHERE THE WATER MAIN IS EITHER ABOVE OR BELOW THE SEWER WITH PREFERENCE TO THE WATER MAIN LOCATED ABOVE THE SEWER.

REQUIRED SEPARATION FOR PERPENDICULAR INSTALLATIONS

INSTALL SECONDARY CONTAINMENT ON EITHER THE WATER OR SEWER MAIN. PIPE CASING EXTENDING NO LESS THAN 9 FEET EACH SIDE OF THE CROSSING OR CONCRETE/CONTROLLED LOW STRENGTH MATERIAL (EX. FLOWABLE FILL) ENCASMENT EXTENDING NO LESS THAN 10 FEET EACH SIDE OF THE CROSSING MAY BE USED. SEE GENERAL NOTE 3.

EXCEPTION A—SEWER UNDER WATER—REQUIRED SEPARATION FOR PERPENDICULAR INSTALLATION CANNOT BE ACHIEVED

INSTALL SECONDARY CONTAINMENT ON EITHER THE WATER OR SEWER MAIN. PIPE CASING EXTENDING NO LESS THAN 9 FEET EACH SIDE OF THE CROSSING OR CONCRETE/CONTROLLED LOW STRENGTH MATERIAL (EX. FLOWABLE FILL) ENCASMENT EXTENDING NO LESS THAN 10 FEET EACH SIDE OF THE CROSSING MAY BE USED. SEE GENERAL NOTE 4.

EXCEPTION B—SEWER OVER WATER—REQUIRED SEPARATION FOR PERPENDICULAR INSTALLATION CANNOT BE ACHIEVED
